14. Memory API

Operating System: Three Easy Pieces

Memory API: malloc()

```
#include <stdlib.h>
void* malloc(size_t size)
```

- Allocate a memory region on the heap.
 - Argument
 - o size_t size : size of the memory block(in bytes)
 - size_t is an unsigned integer type (defined in C standard).
 - Return
 - Success: a void type pointer to the memory block allocated by malloc
 - Fail: a null pointer

sizeof()

- Routines and macros are utilized for size in malloc instead typing in a number directly.
- Two types of results of sizeof with variables
 - The actual size of 'x' is known at run-time.

```
int *x = malloc(10 * sizeof(int));
printf("%d\n", sizeof(x));
```

The actual size of 'x' is known at compile-time.

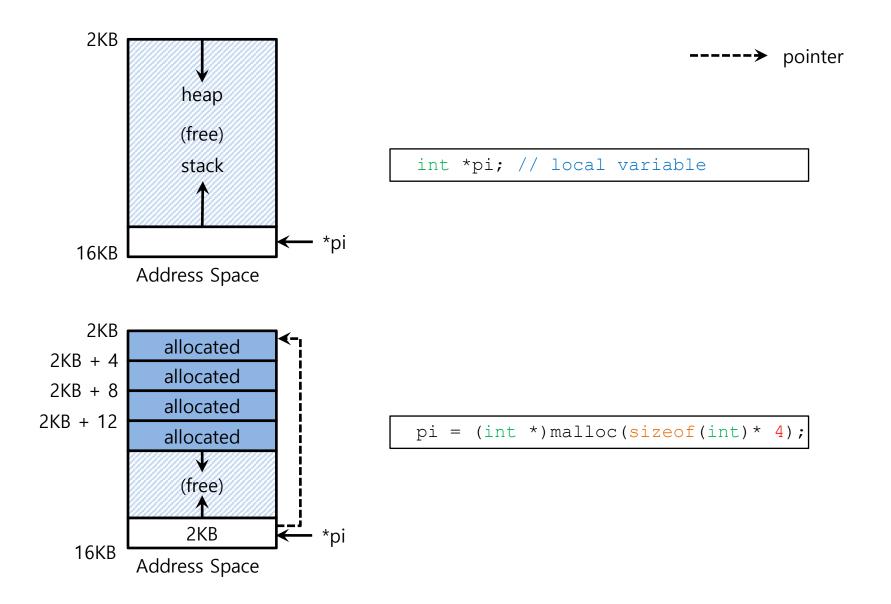

```
int x[10];
printf("%d\n", sizeof(x));
40
```

Memory API: free()

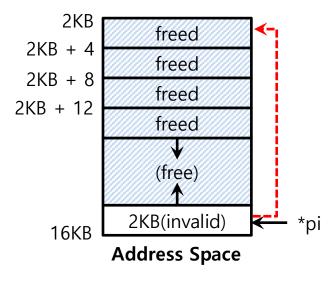

```
#include <stdlib.h>
void free(void* ptr)
```

- Free a memory region allocated by a call to malloc.
 - Argument
 - void *ptr: a pointer to a memory block allocated with malloc
 - Return
 - none

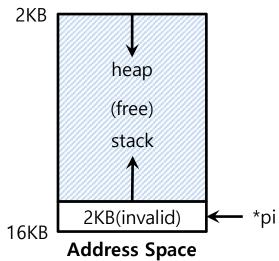

Memory Allocating

Memory Freeing

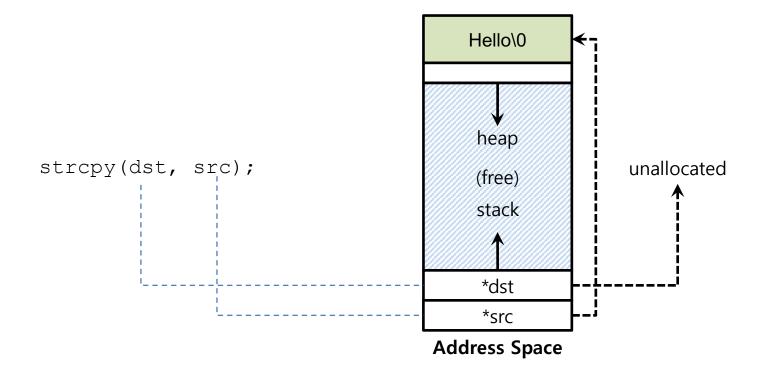

free(pi);

Forgetting To Allocate Memory

Incorrect code

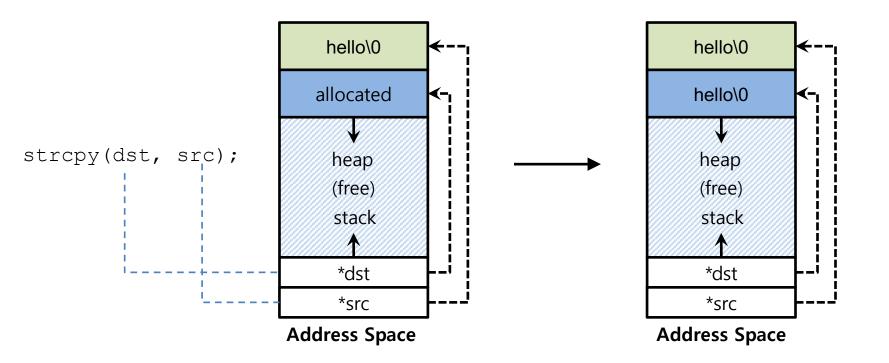

```
char *src = "hello"; //character string constant
char *dst; //unallocated
strcpy(dst, src); //segfault and die
```

Forgetting To Allocate Memory(Cont.)

Correct code

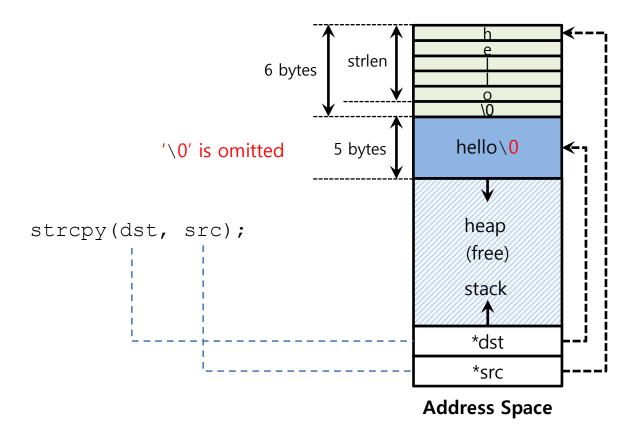

```
char *src = "hello"; //character string constant
char *dst (char *)malloc(strlen(src) + 1 ); // allocated
strcpy(dst, src); //work properly
```

Not Allocating Enough Memory

Incorrect code, but work properly

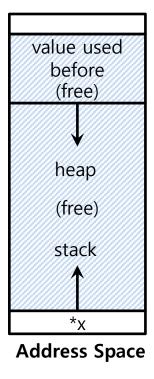

```
char *src = "hello"; //character string constant
char *dst (char *)malloc(strlen(src)); // too small
strcpy(dst, src); //work properly
```

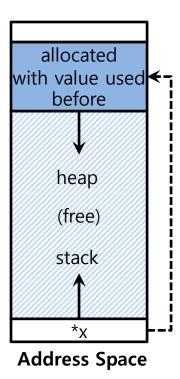

Forgetting to Initialize

Encounter an uninitialized read

```
int *x = (int *)malloc(sizeof(int)); // allocated
printf("*x = %d\n", *x); // uninitialized memory access
```

AOS@UC

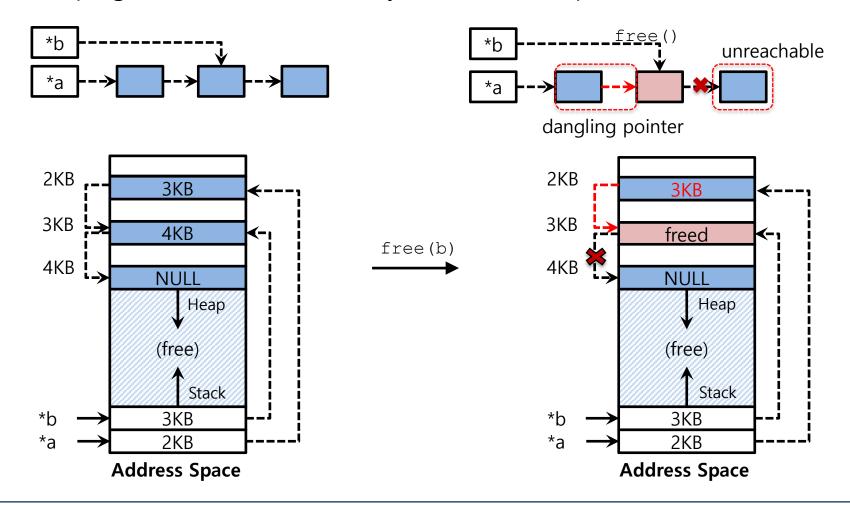

Memory Leak

A program runs out of memory and eventually dies.

: unused, but not freed unused allocated unused unused allocated unused heap unused heap (free) allocated (free) (free) stack stack *d *C *b *b *a *a **Address Space Address Space Address Space** run out of memory

Dangling Pointer

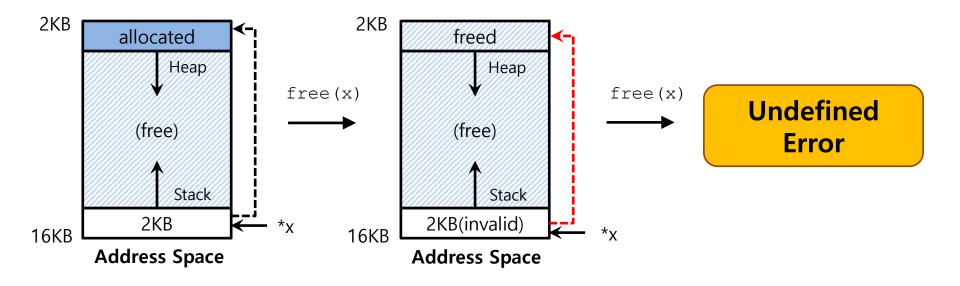

- Freeing memory before it is finished using
 - A program accesses to memory with an invalid pointer

Double Free

Free memory that was freed already.

```
int *x = (int *)malloc(sizeof(int)); // allocated
free(x); // free memory
free(x); // free repeatedly
```

Other Memory APIs: calloc()

```
#include <stdlib.h>
void *calloc(size_t num, size_t size)
```

- Allocate memory on the heap and zeroes it before returning.
 - Argument
 - size t num : number of blocks to allocate
 - size t size : size of each block(in bytes)
 - Return
 - Success: a void type pointer to the memory block allocated by calloc
 - Fail: a null pointer

Other Memory APIs: realloc()

```
#include <stdlib.h>
void *realloc(void *ptr, size_t size)
```

- Change the size of memory block.
 - A pointer returned by realloc may be either the same as ptr or a new.
 - Argument
 - void *ptr: Pointer to memory block allocated with malloc, calloc or realloc
 - o size t size: New size for the memory block(in bytes)
 - Return
 - Success: Void type pointer to the memory block
 - Fail: Null pointer

System Calls

```
#include <unistd.h>
int brk(void *addr)
void *sbrk(intptr_t increment);
```

- malloc library call use brk system call.
 - brk is called to expand the program's break.
 - break. The location of the end of the heap in address space
 - sbrk is an additional call similar with brk.
 - Programmers should never directly call either brk or sbrk.

System Calls(Cont.)

```
#include <sys/mman.h>
void *mmap(void *ptr, size_t length, int port, int flags,
int fd, off_t offset)
```

- mmap system call can create an anonymous memory region
 - Handled like heap
- Maps files/devices into memory (memory mapped I/O)
 - E.g. use: shared access to files across processes/threads
 - E.g. use: open really small files
